1 Select audio

Two-pass EBU R128 to **-11.5 LUFS (-1 dBTP peak)**. Tags and artwork are copied to the new file. **Output format** and file extension come from **Settings → extract format** (FLAC, MP3, or AAC/M4A; default FLAC). For **FLAC** output: audio is **16-bit** at the source sample rate and layout; files are often larger than the original because lossless waveforms are harder to compress — that is expected. With Xiph `flac` installed, FLAC encoding uses `flac --best -e -p`. For **MP3 / AAC**, FFmpeg encodes after loudnorm. Writes `{stem}{suffix}` plus the configured extension beside the original.

Audio: FLAC **Rate:** 48000 Hz **Channels:** 2 **Duration:** 10:49

AUDIO LEVELS

LUFS		-11.6 LUFS
Peak		1.1 dBTP
Mean		-13.0 dB

Likely clipping / extremely hot — true peak 1.1 dBTP, -11.6 LUFS. **Normalisation strongly recommended** (will reduce level toward -11.5 LUFS).

2 Normalise

OUTPUT FILENAME SUFFIX (BEFORE THE FILE EXTENSION)

_LUFS14

Normalise to -11.5 LUFS
